AB - J59106501 Microcapsules with a skin film which crumbles when wet liberating fragrant content to colour adjacent materials, or to develop a colour or cause discolouration by causing a reaction, are interposed between a water impermeable transparent or translucent membrane and a urine absorbing material of a diaper. Suitable material for the skin film of the microcapsule are: (a) materials soluble in water or becoming tearable by water, such as gelatin, gum arabic, carboxymethyl cellulose, polyvinyl alcohol, etc., (b) materials soluble in acidic or alkaline aq. soln. or becoming tearable by such soln. such as amino resin, polyamide, gelatin, sodium alginate, methyl acrylate, etc., (c) materials which become transparent or translucent by wetting by the water, such as gum arabic, starch derivs. talc, etc.

- Suitable materials to be contained in the microcapsule: (d) colourants such as dyes, pigments, pH indicators, etc., (e) materials to be coloured or discoloured by the water such as leuco cpds. of vat dyes, anhydrous CuSO₄, etc., (f) others such as perfumes, colour developing materials.

- The microcapsules are inserted to between a cover material (nylon, polyethylene, etc.) and a urine absorbing material.

- USE/ADVANTAGE - Due to the improvement of water absorbing and retaining capacity of the urine absorbing material for recent diapers, babies will not cry because they feel no discomfort, therefore it is not readily possible to detect whether a baby has excreted or not unless by taking off the diaper.(0/0)
